META-REVIEWER #1

META-REVIEW QUESTIONS

1. Meta-Reviewer Summary

The reviewers agree that the paper addresses an important problem and proposes a technically sound approach. The proposed method is well motivated, demonstrates consistent improvements over competitive baselines, and is evaluated on several challenging benchmarks. The experimental section is comprehensive and includes appropriate ablation studies that support the design choices.

The main concerns raised during the review process relate to the novelty of certain architectural components and the clarity of the presentation.

Overall, the strengths clearly outweigh the remaining minor weaknesses. I therefore recommend acceptance.
