Paper Title

Multi-Modal, Training-Free Crack Extraction via Generalized Frangi Graph

Track Name

EUVIP2026

Reviewer #1

Questions

1. Key strengths of the paper

The work addresses an image processing application and introduces a graph extension of a pixel-wise operator to account for neighbouring pixels in processing tasks. The method performs well without training.

2. Weaknesses of the paper

Some relevant concepts (review of Frangi filters, elongation, etc.) are introduced in a too compact way. The paper should introduce a summary Figure.

8. Overall score

Weak accept

9. Expertise of the reviewer

Beginner

10. Could be nominated for best paper award?

Do not agree

Reviewer #2

Questions

1. Key strengths of the paper

The paper presents an evolution of the FRANGI filter for crack extraction that does not require any type of training obtaining good results with respect to methods

2. Weaknesses of the paper

The innovation level of the paper is not so high

8. Overall score

Strong accept

9. Expertise of the reviewer

Beginner

10. Could be nominated for best paper award?

Do not agree

Reviewer #5

Questions

1. Key strengths of the paper

The paper generates a Franghi similarity graph that enforces structural coherence. The method is annotation-free, generalizable, and robust to noise. The paper provides the results in two different domains.

2. Weaknesses of the paper

1. Are the values of $s_s, s_i, s_a, \tau, \Sigma$, and R experimentally determined and set to these?

The reasoning behind picking these values would be useful.

2. Defining 'Test1' and 'Test2' somewhere in the text will make it more readable.

3. The order of the components in Table I could be the same as the order they are described; this would improve readability.

4. Suggestion: Assign a variable to the distance factor. It was hard to follow throughout.

5. It would have been better if the authors could provide results on more datasets. The reviewer understands that the annotated data is scarce. But the reviewer is not convinced that the results on two images from another type of data are enough to provide proof for the effectiveness of the method across different domains.

8. Overall score

Weak accept

9. Expertise of the reviewer

Out of my scope of expertise

10. Could be nominated for best paper award?

Do not agree
